

## DANISH AGRO INDUSTRY | STABLE SOLUTIONS

**Daltec is a developer and producer of feeding- and conveying systems for agriculture and the food industry.**

### COMPANY PROFILE

In 1982 Daltec had their first own designed and patented sourced system, due to an increasing demand for quality products. Since then the product range have increased.

All Daltec products are designed to distribute feed in the most efficient however simplest way with solutions from basic conventional filling systems to more sophisticated computer-controlled ration feeding systems for individual pen supply.

Daltec is in its second generation, since Michael Dall and Christian Dall took over from founder Thøge H. Dall. Both Michael and Christian have brought their own knowledge and practical experience of the industry and continue Daltec' s innovation to meet the demands of the farmers of today as well as the future farmers.

### PRODUCTS

All Daltec drive units are equipped with the unique friction drive pulling method. With this method the cable is pulled forward by means of friction created between the pulling wheel and the discs on the cable. Longer conveyors can easily be achieved by adding additional drive units in to the line.

Furthermore, it ensures a longer life time to the systems and lower maintenance compared to other solutions with sprockets.
